Prior art findings and patent filing status

Before a single investor conversation was initiated, the question of prior art was answered through direct search.

A strict Boolean query of nine words submitted to the USPTO database with AND operators returned zero matches. A subsequent three-string AND operator search confirmed the result. The searchable patent record contains no prior art.

The same question was put to multiple large language models — systems trained on the broadest available corpus of existing business models, platform architectures, and technology categories. None returned a matching framework. None identified an existing business operating across the full set of categories this platform merges.

The absence is not an oversight in the search methodology. It is the finding.

A provisional patent application is on file. Priority date: March 16, 2026. Sole inventor. Small entity status. Non-provisional utility application pending.
